

XPP 9.6.1 Service Pack Available Now!

July 6, 2022

We are pleased to announce the availability of Service Pack 1 for XPP 9.6.

In addition to a roll-up of issue fixes, this release also includes:

- Added platform support for MS Windows 2022 Servers and MS Windows 11 Clients
- Added support for creating custom page labels in PDF
- Introduced a new Style Data input/output program without GUI elements

Any maintenance customer currently using SDL XPP 9.x is entitled to this v9.6.1 Service Pack. We encourage you to upgrade to this latest version release, even if you have already received Hot Fix patches.

As with any new release we ask that you review the Service Pack Release Notes and Fixed Issues Report prior to installing the Service Pack. The Release Notes, along with the SDL XPP Documentation set is available here: <https://docs.rws.com/XPP9.6>

To initiate the ordering and delivery of this version release, or to obtain a copy of the Fixed Issues Report, please open a support ticket through the RWS Customer Support Web Portal.

Effective with the XPP 9.6.1 version, the release status will be:

- Full Support (previously called Active and Mature): XPP 9.6.1, XPP 9.4.2
- Retired: XPP 9.6.0, XPP 9.4.1 and previous

Customers running on retired releases should consider upgrading soon as although we may still be able to provide technical support, we are not able to provide Hot Fixes for a retired version release.

Should you have any questions concerning this announcement, please do not hesitate to contact SDL Customer Support.
